**Note: Proper sample collection is critical.**

To sample water for lead and copper, you must take a one liter (quart) sized "first draw sample". This means sampling after the water has had time to sit in the pipes for about eight hours. Most people sample from the kitchen sink, first thing in the morning. The bottle should be opened and placed under the faucet to catch the first drop of COLD water. Fill up the one liter (quart) bottle. An additional one liter sample of the unsoftened water will be required to complete this package. Please refer to the back of the bacteria form for the sampling instructions for coliform bacteria.
